Traffic Analysis Capture Files

This directory contains packet capture (PCAP) files collected during the Sydney TaxCare Services network security assessment. These captures provide technical evidence of network traffic observed during testing activities and support the findings presented in the final security assessment report.

The files were generated to analyse communication between devices, validate firewall configurations, verify access control policies, and confirm the effectiveness of implemented security controls. Testing included HTTP traffic analysis, ICMP connectivity checks, management interface access verification, and firewall rule validation before and after security hardening measures were applied.

Packet captures were examined using Wireshark to inspect packet flows, protocol behaviour, source and destination addresses, and access attempts. The results helped identify whether network traffic was permitted, restricted, or blocked according to the intended security requirements.

These capture files serve as supporting evidence for assessment findings and demonstrate that conclusions and recommendations were based on practical testing, network monitoring, and documented technical observations rather than theoretical assumptions alone.
